

Driverless Vehicles.

Effects on Traffic Flow & Accident Rates.

Alex Molodyh
Michael Brown

(Revised) Vision Statement

For people who want to see how artificial intelligence should decrease the rate of traffic accidents in the United States, the AI Traffic Model is a model that will provide such information regarding human and self-driven cars. The model will use data based on traffic accidents caused by humans while driving in various conditions such as driving under the influence of substances, using mobile devices, fatigue, road rage, and human error. Unlike current models about traffic, our model will include predictive data about artificial intelligence's effect on traffic.

Total drivers in US: 221,712,000

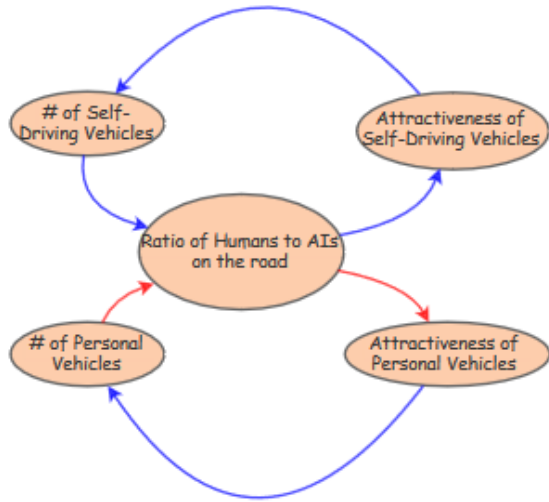

Types of deaths caused by accidents:

Distraction-related deaths (3,450 fatalities) decreased by 2.2 percent	0.00001556
Drowsy-driving deaths (803 fatalities) decreased by 3.5 percent;	0.00000362
Drunk-driving deaths (10,497 fatalities) increased by 1.7 percent;	0.00004735
Speeding-related deaths (10,111 fatalities) increased by 4.0 percent;	0.00004560
Unbelted deaths (10,428 fatalities) increased by 4.6 percent;	0.00004703
Motorcyclist deaths (5,286 fatalities – the largest number of motorcyclist fatalities since 2008) increased by 5.1 percent;	0.00002384
Pedestrian deaths (5,987 fatalities – the highest number since 1990) increased by 9.0 percent; and	0.00002700
Bicyclist deaths (840 fatalities – the highest number since 1991) increased by 1.3 percent.	0.00000379
